

Shero Home Food — WhatsApp Ordering Bot

Flow & Requirements

Prepared by Xtracut · 21 September 2026

Overview

Customers click a Meta ad, land in WhatsApp, order from the Meta catalogue, book a delivery slot, and pay through Stripe, with every step tracked in Zoho CRM. Online delivery orders only; no takeaway.

System	Role in the flow
Meta Ads (Click-to-WhatsApp)	Entry point; passes ad/campaign details to the bot
WhatsApp via Gallabox	Conversation, bot logic, templates, agent handover
Meta Catalogue API	Product list, dish prices, images, cart
Backend APIs (client)	Nearby outlets and distance, serviceability, delivery slots and booking, order status
Uber API	Delivery charge and extra taxes/fees quote
Stripe	Payment link, payment status, refunds
Zoho CRM	Lead → Contact, stage tracking, order records

1. WhatsApp Conversation Flow

The bot offers an optional Check Availability option alongside the cuisine choice, then shows the menu. Location is required only after the cart, before payment: the bot checks serviceability, shows nearby outlets with distance in km, books an available slot, and collects payment.

Step-by-step

#	Step	Bot action	Customer input	If it fails
1	Entry	Customer clicks Click-to-WhatsApp ad; bot captures phone number and ad/campaign ID	Pre-filled message	—
2	Returning check	Look up phone number in Zoho; if a Contact exists, greet by name and skip to step 5	—	—
3	Welcome	“Welcome to Shero” → ask full name	Name	Re-ask if empty
4	Email	Ask email ID	Email	Re-ask if format is invalid
5	Main menu	Buttons: Order Online / Talk to Us	Button tap	Talk to Us → hand over to Gallabox agent
6	Cuisine + Check Availability	List: Andhra, Kerala, third option (to be confirmed), plus a Check Availability option	Selection	—

#	Step	Bot action	Customer input	If it fails
6a	Check Availability (optional)	Customer shares location pin or ZIP. Available: show nearby outlets with distance in km, then return to step 6 (location saved, step 9 skipped)	Location / ZIP	Not serviceable → polite message, record in Zoho
7	Menu	Send catalogue product list for the chosen cuisine, with dish prices from the Meta Catalogue API	Browses items	—
8	Cart	Customer adds items and sends the cart	Cart	Item unavailable → notify and re-show menu
9	Location (mandatory before payment)	Ask for location pin or ZIP code if not already shared; backend calculates distance to every outlet	Location / ZIP	Re-ask if location can't be read
10	Serviceability	Serviceable if at least one outlet is within its delivery range	—	Not serviceable: polite message, record in Zoho, end
11	Nearby outlets	Show serviceable outlets, nearest first, with distance (e.g. "Shero Edison – 3.2 km")	Picks outlet (auto-selected if only one)	Cart item not available at that outlet → notify and let customer edit cart
12	Delivery details (mandatory)	Collect full address, apartment/unit, delivery instructions, contact number	Details	Block payment until all fields are filled
13	Delivery slot	Fetch available slots for the outlet from the backend (only slots within operating hours are returned); slot is held while payment is pending	Picks slot	No slots today → show next available day's slots
14	Order summary	Dish prices, Uber delivery charge and extra taxes/fees, total, slot; buttons Confirm / Edit / Cancel	Button tap	Edit → back to step 7
15	Payment	Create Stripe Checkout link with order ID; send via payment template	Pays on Stripe page	Reminder after 15 min; link expires after 30 min and the slot is released
16	Payment result	Stripe webhook confirms payment → backend books the slot → send confirmation with order ID and slot	—	Failed payment → send retry link
17	Kitchen alert	Notify the selected outlet of the new paid order and slot	—	—
18	Delivery updates	Outlet marks Out for Delivery / Delivered in the backend → WhatsApp message to customer	—	—
19	Feedback	After delivery, ask for a rating	Rating	—

Pricing shown to the customer

Item	Source	Shown at
Dish price	Meta Catalogue API	Menu and order summary
Delivery charge and extra taxes/fees	Uber API (delivery quote)	Order summary
Total	Backend (dish total + Uber charges)	Order summary and payment link

2. Zoho CRM Flow

Every new WhatsApp number becomes a Lead, each bot step updates the Lead's stage, and a successful payment converts the Lead into a Contact with an Order record.

Lead stages (drop-off tracking)

Stage	Set when	Bot step
New Enquiry	First message received	1
Details Captured	Name and email received	3-4
Cuisine Selected	Cuisine chosen	6
Cart Created	Cart sent from catalogue	8
Not Serviceable	No outlet within delivery range	6a or 10
Outlet Selected	Customer picks a nearby outlet	11
Slot Selected	Delivery details and slot captured	12-13
Payment Link Sent	Summary confirmed, Stripe link sent	14-15
Payment Abandoned	Link expired unpaid	15
Payment Failed	Stripe reports failure	16
Converted	Payment successful → Lead converted to Contact	16

Each stage change also stores a timestamp, so reports show where and when customers drop off.

Order stages (after conversion)

Stage	Source
Paid & Slot Booked	Stripe webhook + backend
Sent to Kitchen	Outlet notified
Out for Delivery	Outlet update in backend
Delivered	Outlet update in backend
Cancelled / Refunded	Backend + Stripe refund

Data mapped into Zoho

Record	Fields
Lead / Contact	Name, WhatsApp number, email, address, ZIP, selected outlet, distance (km), cuisine preference, lead source (Meta ad), ad/campaign ID, stage, stage timestamps
Order	Order ID, Contact, outlet, items and quantities, dish total, delivery charge, tax, total, delivery slot, Stripe payment ID, order stage, delivered time

- Returning customers are matched by WhatsApp number: no duplicate Lead; a new Order is added under the existing Contact.
- Abandoned and failed-payment Leads can be followed up through a Zoho workflow using the re-engagement template.

3. WhatsApp Templates to Create

These 10 templates need Meta approval in Gallabox before go-live; replies inside the live conversation (welcome, menu, questions) do not need templates.

Payment templates (Stripe)

Template	Category	Trigger	Sample body	Button
payment_link	Utility	Order summary confirmed	Hi {{1}}, your Shero order #{{2}} comes to \${{3}} for the {{4}} delivery slot. Tap below to pay securely. The link is valid for 30 minutes.	Pay Now (dynamic URL)
payment_reminder	Utility	15 min unpaid	Hi {{1}}, your order #{{2}} is waiting for payment. Complete it to keep your {{3}} delivery slot.	Pay Now (dynamic URL)
payment_success	Utility	Stripe payment confirmed	Payment received! Your order #{{1}} of \${{2}} is confirmed from {{3}} for delivery at {{4}}.	—
payment_failed	Utility	Stripe payment failed	Hi {{1}}, your payment for order #{{2}} didn't go through. Please try again.	Retry Payment (dynamic URL)
payment_expired	Marketing	Link expired unpaid	Hi {{1}}, your cart is still saved. Want to complete your Shero order?	Order Now
refund_processed	Utility	Stripe refund issued	Your refund of \${{1}} for order #{{2}} has been processed. It may take 5-10 business days to reflect.	—

Order and delivery templates

Template	Category	Trigger	Sample body	Button
order_out_for_delivery	Utility	Outlet marks Out for Delivery	Your order #{{1}} is on its way!	—
order_delivered	Utility	Outlet marks Delivered	Your order #{{1}} has been delivered. Enjoy your meal!	—
order_cancelled	Utility	Order cancelled by outlet	Sorry, your order #{{1}} has been cancelled. A full refund has been started.	Talk to Us
feedback_request	Marketing	30 min after delivery	How was your Shero meal today? Rate your order #{{1}}.	Quick replies: Great / Good / Poor

Note: Stripe checkout links are long, so the Pay Now button should point to a short redirect on the client's domain (for example, `pay.<domain>/{{order_id}}`) hosted on the AWS server.

4. Requirements from Client

Development starts once the access and details below are shared.

Access and credentials

The backend API rows below are our understanding of what is needed; please confirm, and share any APIs or pages that already exist.

System	What we need	Used for
Meta	Admin/partner access to the Business Portfolio (Business Manager)	Managing WhatsApp, catalogue and ads
Meta	Commerce Manager access to the catalogue	Product list and dish prices via the Catalogue API
Meta	WhatsApp Business Account access	Messaging and templates
Meta	Ad account access	Reading Click-to-WhatsApp campaign data
Meta	Business verification status	Template approval and messaging limits
Meta Catalogue	Google Sheet menu access	Source for catalogue items
Meta Catalogue	For each item: name, price, description, cuisine, outlet, image	Completing the catalogue and fixing image display
Backend API	Nearby restaurants API: takes the customer's location (pin or ZIP), calculates the range, and returns nearby restaurants with distance in km; if not within the delivery range, returns "not available"	Check Availability and serviceability
Backend API	Slots API: returns the available delivery slots for the selected restaurant	Slot selection
Backend API	Existing payment API or payment page, if any	Reusing it instead of building a new Stripe checkout
Uber	Uber Direct API credentials (Customer ID, Client ID, Client Secret)	Delivery charge and extra taxes/fees quote
Uber	Pickup address of each outlet	Delivery quote
Zoho CRM	Admin user login (or add our email as Administrator)	Leads, contacts and orders setup
Zoho CRM	Zoho edition/plan and data center (zoho.com / zoho.in)	API limits and setup
Zoho CRM	Approval to create custom fields, stages and an Orders module	Stage and order tracking
Stripe	Add our email as Developer team member	Payment setup
Stripe	Account activated for live payments	Taking real payments
Stripe	Test and live API keys (publishable + secret); we will create the webhook	Payment links and payment status
Stripe	Currency, tax settings and refund policy	Checkout and refunds
Gallabox	Admin login and API key	Bot and templates
Gallabox	Confirmation that the plan supports API, webhooks and bot builder	Bot integration
Gallabox	Connected WhatsApp number	Messaging
AWS	IAM user with required permissions (not root) and preferred region	Hosting the bot server
Gmail	Gmail access	Server proxy
Domain	DNS access for a subdomain	Webhooks and payment redirect
